FOR IMMEDIATE RELEASE

***Aegis™ Integration Software Has Become More Powerful  
with the Release of Aegis2™***

Las Vegas, NV (March 28, 2007) – KapLogic Corporation has announced that Aegis2™ will be launched at ISC West in Las Vegas. Aegis™, KapLogic's command and control graphical user interface for the security industry, has been the standard for ease-of-use and seamless integration of disparate systems since 2002.

KapLogic's highly acclaimed Aegis™ integration software solution provides users with unprecedented levels of scalability with a consistent, simple user interface where all normal functions can be performed as a point-and-click operation.

"Over the last five years, Aegis™ has performed very well in not only modest installations but also in some of the nation's most critical security environments," says Dick Beard, President of KapLogic. "Aegis2™ adds additional features and functionality to this well proven security integration software."

More than twenty major manufacturers look to Aegis™ to provide their customers with virtually unlimited integration capabilities. Aegis delivers the ability to mix-and-match disparate manufacturers' systems to create the most effective system for their customers' security needs.

Powerful video capabilities have been added to Aegis2™. "We have expanded the video functionality to meet the needs of our customers" says Mark Repetto, Vice President and CTO of KapLogic. Drag and drop video between video frames, ability to sequence live video, alarm video and alarm playback video along with consistent on-screen-display regardless of the digital video systems installed are just a few of the added video features.

The Aegis™ software package allows security systems such as CCTV, access control, alarm and intercom systems to be combined to form a truly integrated security system. Advanced alarm handling and event linking automate alarm response to give the operator critical information in emergency situations. All devices are represented by icons, which provide real-time status so an operator can instantly determine the status of the complete facility.

Use of AutoCAD files in their native format has always been standard in Aegis™, but now with Aegis2™ multiple map views can be created using a single CAD file. Map zoom in/out capabilities are now standard. User privileges, log capabilities, scheduling and numerous other features have been expanded or added.
